

Fusion Harness *An innovative concept*

The Fusion is the realisation of a Nervure concept of a modular harness. This harness is perfectly suited for a pilot who practises different forms of paragliding (mountain flying, cross, bivy flight, tandem) and wishes to adapt his/her harness without compromise for each of them.

The Base

Base is a bare harness. It has a very good weight to comfort ratio. It is designed to be used in sitting position with independent leg movements. The back is hardened using a compressed foam with a high density. All settings can be modified in flight; legs, chest straps, depth, reclining and shoulder position. Weight: 1001 gram

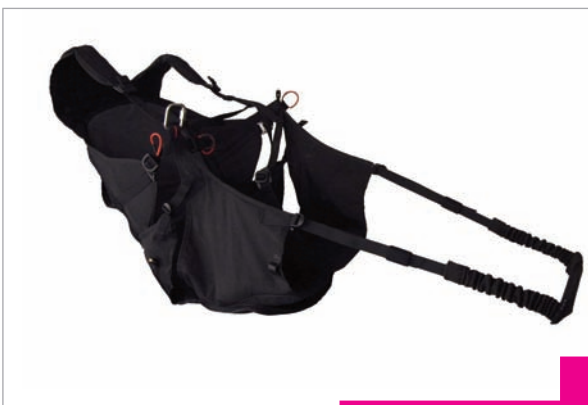

Seat Board

If you want to fly with a seat board, a carbon plate fits in a dedicated space under the seat to transform the harness into a seat board harness. Seat board weight: 131 gram

Supine harness

If you prefer to fly in supine or semi-supine position you can install the foot stirrup. The angles and tensions can be set to match the pilot morphology. In this configuration the harness can be used with or without the seat board, you choose. The seat board changes the feedback and the weight shift effect on the wing.

Weight of the stirrup: 122 gram

Reversible integral air-bag bag accessory

The harness can be fitted with a reversible airbag, it is zipped around the whole back of the harness bonding the two perfectly. The rucksack has enough room to accommodate a tandem paraglider without difficulty. Carrying is made comfortable by using tunnelled back foam and wide padded belt. The bag is fitted with a mesh pocket, a zippered pocket on the belt, straps for walking sticks and compression straps.

Bag weight: 1284 grams

Container bivy flight accessory

The bivy flight fans are looking for light weight gear with excellent carrying comfort. Usually they will not choose a reversible airbag as the comfort degrades when the weight carried is above 20kg; if this worries you there is a specific Bivouac Rucksack (110 l) that can be stored in special pouch in the back of the harness improving the overall carrying comfort of the harness. The Bivouac Accessory is an ultra light container made of three compartments that is zipped integrally to the harness. The size of compartments is designed to fit all the necessary bivouacking equipment; compact and heavy items under the seat, light and voluminous items at the top. The central pocket is design to store valuable items that need quick access. It also has a pocket to store a water pouch and a loop for the feeding tube for in-flight drinking.

Under seat reversible airbag accessory for tandem passenger

While flying tandem it is important to protect the passenger. Integral airbag can sometime be ineffective especially if flown using soft spreader where the pilot will partial deflate the airbag. Back foam is heavy and bulky. Our under seat airbag accessory is fully zipped to the whole harness for a perfect bond between the two. The small reversible top pocket allows the passenger to carry his harness and a few items (clothes, food, helmet, water ...). Fitted with this accessory the harness is the lightest airbag tandem passenger harness on the market.

Under seat airbag weight: 880 grams
